TECHNICAL WRITING PORTFOLIO

Outcome-focused case-study draft

A recruiter-facing review copy showing how the portfolio can demonstrate documentation ownership, quality controls, collaboration, and measurable sample scope without exposing confidential employer information.

Review note: This professional-work case study uses qualitative evidence only. No employer percentage, customer, schedule, or operational metric has been invented.

Aviation and industrial documentation

AREA	DETAIL
Challenge	Convert approved engineering changes and source data into maintenance and service content that technicians can use safely and reviewers can trace.
Audience	Maintenance technicians, service engineers, installation teams, engineering reviewers, and quality reviewers.
Role	Analyze change impact, author and revise procedures, coordinate technical queries, support illustrations, and prepare deliverables for review.
Content	Maintenance manuals, service instructions, installation and operation manuals, service bulletins, technical reports, and illustrated parts catalogues.
Working model	Structured authoring, controlled language, engineering-source traceability, and SME review.

Ownership and approach

- Performed change-impact analysis to identify affected manuals, tasks, figures, part references, and cross-references before drafting began.

- Converted approved engineering source data into task-oriented procedures with prerequisites, safety information, ordered actions, and verification points.

- Collaborated with engineers and subject-matter experts to resolve technical queries and confirm interpretation before final review.

- Applied structured authoring and controlled language to support consistency, reuse potential, and translation readiness.

AVIATION AND INDUSTRIAL CASE STUDY

Outcomes and evidence

The workflow produced maintainable, review-ready documentation that connected engineering changes to affected maintenance content. It helped technicians find required conditions, actions, illustrations, and verification information in the order needed to complete a task.

AREA	DETAIL
Change control	Impact analysis identified affected manuals, tasks, figures, and references before content was finalized.
Task usability	Procedures were structured around prerequisites, safety information, ordered steps, and verification points.
Technical accuracy	Content decisions were traced to approved engineering source data and technical queries were resolved with SMEs.
Review readiness	Terminology, warnings, figures, references, and revision impact were checked before delivery.
Maintainability	Structured authoring and controlled language supported consistent updates, reuse, and translation preparation.

Metrics that can be added with approval

Approved, properly sourced metrics would make this professional-work case study even stronger. Suitable measures include documentation-change coverage, review-cycle time, technical-query closure rate, first-pass review acceptance, reuse coverage, and support-content effectiveness. Each claim should include its reporting period, baseline, and source.
